Provincially And Regionally Significant Wetlands In Southern Ontario Interim Report, 1987

V Glooschenko Ontario

Ontario, the Carolinian Life Zone is a rich and diverse network of wetlands. The region is home to a variety of ecosystems, including bogs, fens, swamps, marshes, and lakes. These ecosystems are vital for the health of the region's water quality and biodiversity. The Ministry of Natural Resources and the Regional Municipality of Halton, in collaboration with other organizations, have conducted extensive studies to identify and protect these wetlands. The annual Drinking Water Quality Report – Acton Well Supply, published in 1987, highlights the importance of wetlands in ensuring water quality. The report emphasizes the need for continued monitoring and protection of these ecosystems to maintain their ecological integrity. The Wetland Evaluation Guide, published by the Ministry of Natural Resources, provides a methodology for assessing the significance of wetlands. This guide is crucial for identifying areas that warrant protection and for developing strategies to mitigate impacts on these ecosystems. Additionally, the Provincially and Regionally Significant Wetlands in Southern Ontario – Interim Report, published in 1987, offers a detailed list of wetlands that are significant at the provincial and regional levels. This report is a valuable resource for identifying and protecting wetlands that contribute to the region's ecosystem services.
